| Quarter size hail was reported at Lelia | a Lake. | | | |

Thunderstorms developed across the western Texas Panhandle during the afternoon of the 11th in an environment characterized by moderate instability and modest shear. Severe thunderstorms produced hail up to half dollar size and strong wind gusts as high as 76 mph as they moved east across the Texas Panhandle during the evening. Heavy rain brought flooding and flash flooding to the city of Borger.

Quarter size hail fell in Lutie.

A surface low pressure system over northeast New Mexico moved southeast during the late afternoon and evening hours. A cold front moved southeast across the panhandles from northwest to southeast behind the low pressure system. Severe thunderstorms developed across northeast New Mexico during the afternoon and then moved southeast across the panhandles. Low level shear helped to create an environment favorable for tornadic supercells in the Texas Panhandle. Tornadoes were well documented by spotters and storm chasers through photos and video, and four caused minor damage.

A dryline sharpened during the afternoon and significant moisture surged northwestward. This set the stage for supercell thunderstorms capable of very large hail. Low level shear was most favorable for tornadoes in Kanasas, although one brief tornado did occur in the northern Texas Panhandle. Storms were LP in nature and the largest hail of the day was 3.5 inches in diameter.

Quarter size hail fell near Allison.

Most of the severe thunderstorms on the 26th were east in Oklahoma where the higher moisture and greater instability was located. Nevertheless, a sharpening dyline across the eastern Texas Panhandle during the late afternoon and into the evening resulted in the development of a hail producing thunderstorm in Lipscomb County. A brief tornado was witnessed by spotters near Higgins.
